What is Monitoring?

Monitoring is the continuous process of collecting, analyzing, and visualizing system and application metrics to understand the performance, availability, and overall health of your infrastructure.

What is Prometheus?

Prometheus is a free and open-source tool used to monitor computers, servers, applications, and cloud systems. It helps you collect and store data about how your system is working like CPU usage, memory, disk space, and more and shows you that data in a way that's easy to understand.

Prometheus is like a smart assistant that keeps checking how your systems are doing and tells you when something needs your attention.

What is Grafana ?

Grafana is a free and open-source tool used to create beautiful dashboards and visualize monitoring data collected from tools like Prometheus. Instead of looking at raw numbers, Grafana helps you see graphs, charts, and alerts which makes it easier to understand what's happening in your system.

Grafana is like a dashboard in a car it shows you everything about your system in one place, in a way that's easy to see and understand.

Why Use Prometheus + Grafana?

When you use Prometheus and Grafana together, you get a powerful and easy way to monitor your system.

- Prometheus collects data like CPU usage, memory, disk space, and more.
- Grafana shows that data using beautiful graphs and charts.

In short Prometheus watches your system. Grafana shows you what's happening clearly and beautifully. Together, they make system monitoring easy and smart.

How Prometheus works ?

1. Prometheus asks other tools (called exporters) for system data — like "Hey, what's the CPU usage now?"
2. Exporters give the data (like CPU: 30%, Memory: 40%).
3. Prometheus stores this data with the time it was collected (this is called "timeseries data").

4. You can see or analyze this data using its own web page or by connecting it to a tool like Grafana for beautiful dashboards.

How Grafana works ?

1. Grafana connects to Prometheus (or other data sources)
2. It reads the monitoring data (like CPU usage, memory, etc.)
3. You can use Grafana to create dashboards and display that data in graphs
4. You can also set alerts, so Grafana notifies you if something is wrong.

What is Node Exporter?

Node Exporter is a small tool used with Prometheus to collect hardware and system metrics from your Linux server.

It **runs on each server (node)** you want to monitor and provides important data like:

- CPU usage
- Memory usage
- Disk space
- Network traffic
- System uptime

Prometheus then **pulls this data** from Node Exporter and stores it for analysis or alerting.

How Node Exporter Works ?

You install Node Exporter on a Linux server. 1.

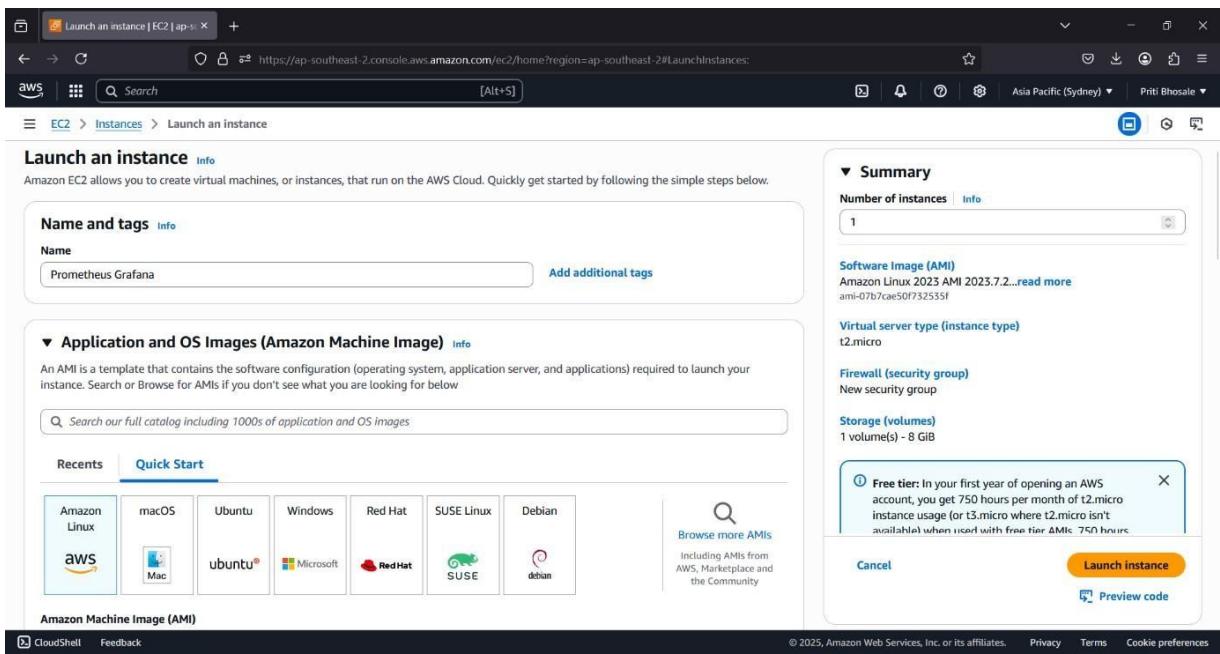

It starts running and exposes data at:

`http://<server-ip>:9100/metrics`

2. Prometheus accesses this URL to **collect metrics** regularly.
3. You can visualize the data in Grafana as graphs, gauges, and charts.

Install Prometheus on EC2 Instance

1. Launch an Amazon Linux EC2 Instance

2. Execute the below commands to install the Prometheus

- copy these all lines and execute as one command

```
-----  
sudo tee /etc/yum.repos.d/prometheus.repo <<EOF
```

```
[prometheus] name=Prometheus
```

```
baseurl=https://packagecloud.io/prometheus-rpm/release/el/7/x86_64
```

```
repo_gpgcheck=1 enabled=1
```

```
gpgkey=https://packagecloud.io/prometheus-rpm/release/gpgkey
```

```
https://raw.githubusercontent.com/lest/prometheus-rpm/master/RPM-
```

```
GPGKEY-prometheus-rpm gpgcheck=1 metadata_expire=300
```

```
EOF
```

```
-----  
Then:
```

```
- sudo yum update -y
```

```
- sudo yum -y install prometheus2 node_exporter
```

```
- rpm -qi prometheus2
```

```
- sudo systemctl start prometheus node_exporter
```

- sudo systemctl status prometheus.service node_exporter.service

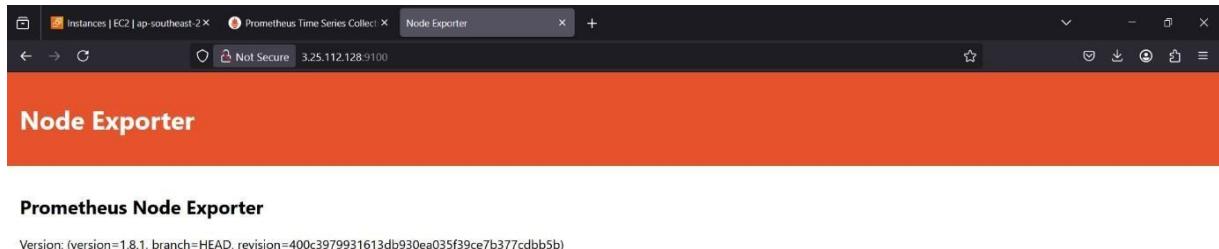

3. add port 9090 for Prometheus and port 9100 for Node Exporter in security group

Security group rule ID	Type	Protocol	Port range	Source	Description - optional
sgr-00d6e949f81eb86cd	HTTPS	TCP	443	Custom	
sgr-0cd0f6796537b3859	HTTP	TCP	80	Custom	
sgr-00370bd7c632fa9a6	SSH	TCP	22	Custom	
-	Custom TCP	TCP	9090	Anyw...	
-	Custom TCP	TCP	9100	Anyw...	

3. copy ec2 public IP and paste in browser with port no 9090 now you should see Prometheus dashboard.

Table	Graph
Evaluation time < >	
No data queried yet	

To see Node Exporter copy ec2 public IP and paste in browser with port no 9100

How to Configure Prometheus ?

After installing Prometheus, the most important step is configuring what to monitor — this is done in the `prometheus.yml` file.

Exporters like **Node Exporter**, **Blackbox Exporter**, etc., expose system or service metrics. You tell Prometheus where to find them using `scrape_configs`.

Example: Adding Node Exporter 1.

Open the Prometheus config file:

```
sudo nano /etc/prometheus/prometheus.yml
```

2. Add the following lines to the `scrape_configs` section:

`scrape_configs:`

```
- job_name: 'node_exporter'      static_configs:  
- targets: ['localhost:9100']
```

□ `job_name`: A label to identify this exporter □
`targets`: Where the exporter is running (IP:port)

3. Restart Prometheus

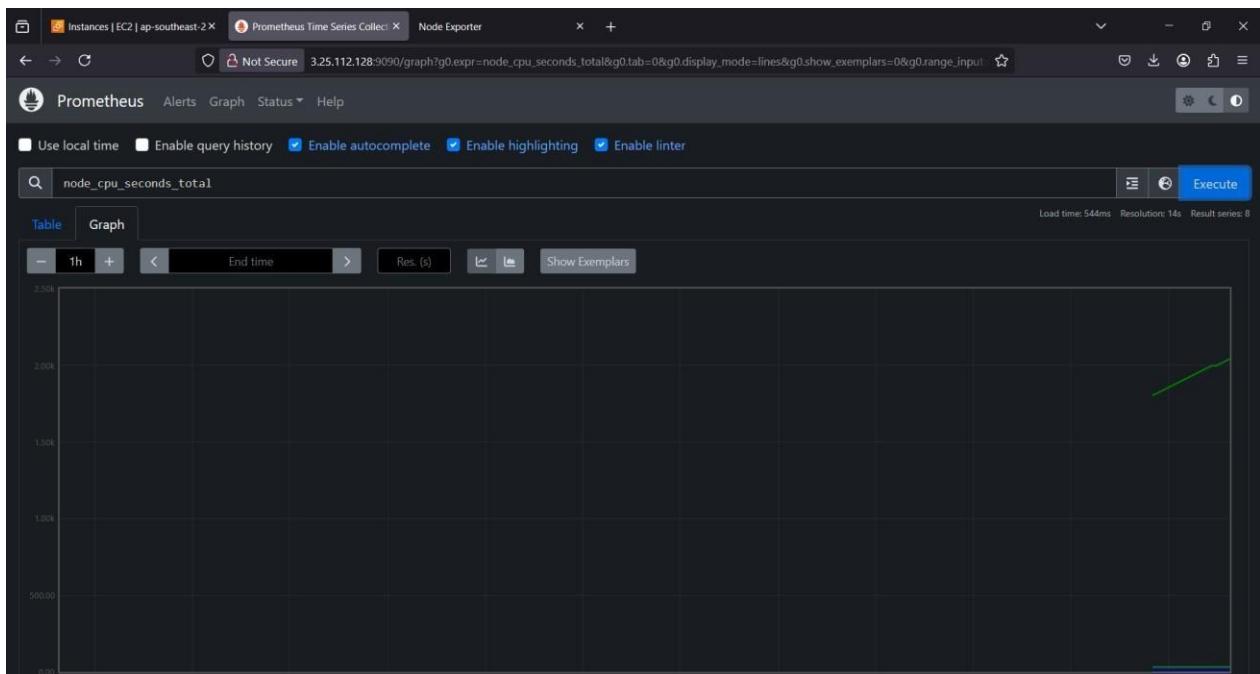

After editing the config file, restart Prometheus to apply changes:

```
sudo systemctl restart prometheus
```

4. Open your browser and go to: `http://<your-server-ip>:9090`

In the **Prometheus dashboard**, go to the "Targets" page to confirm that `node_exporter` is active. □ Click on the "Graph" tab:

- Type any metric starting with `node_` (e.g., `node_cpu_seconds_total`)
- Click "Execute"
- You'll see live metric data

What is Alert manager in Prometheus ?

Alertmanager is a tool that works with Prometheus to manage and send alerts.

Prometheus detects problems, but Alertmanager is the one that sends notifications to you (via Email, Slack, Teams, etc.).

#Detailed setup of Alertmanager is out of scope for this document, but can be explored when implementing advanced alerting.

Install Grafana on EC2 Instance

Install Grafana using the official repository

1. Execute the below commands to install the Prometheus -

copy these all lines and execute as one command

```
sudo tee /etc/yum.repos.d/grafana.repo<<EOF
[grafana] name=Grafana
OSS
baseurl=https://packages.grafana.com/oss/rpm
repo_gpgcheck=1
enabled=1 gpgcheck=1
gpgkey=https://packages.grafana.com/gpg.key EOF
```

Then:

```
sudo yum install grafana -y sudo
systemctl start grafana-server sudo
```

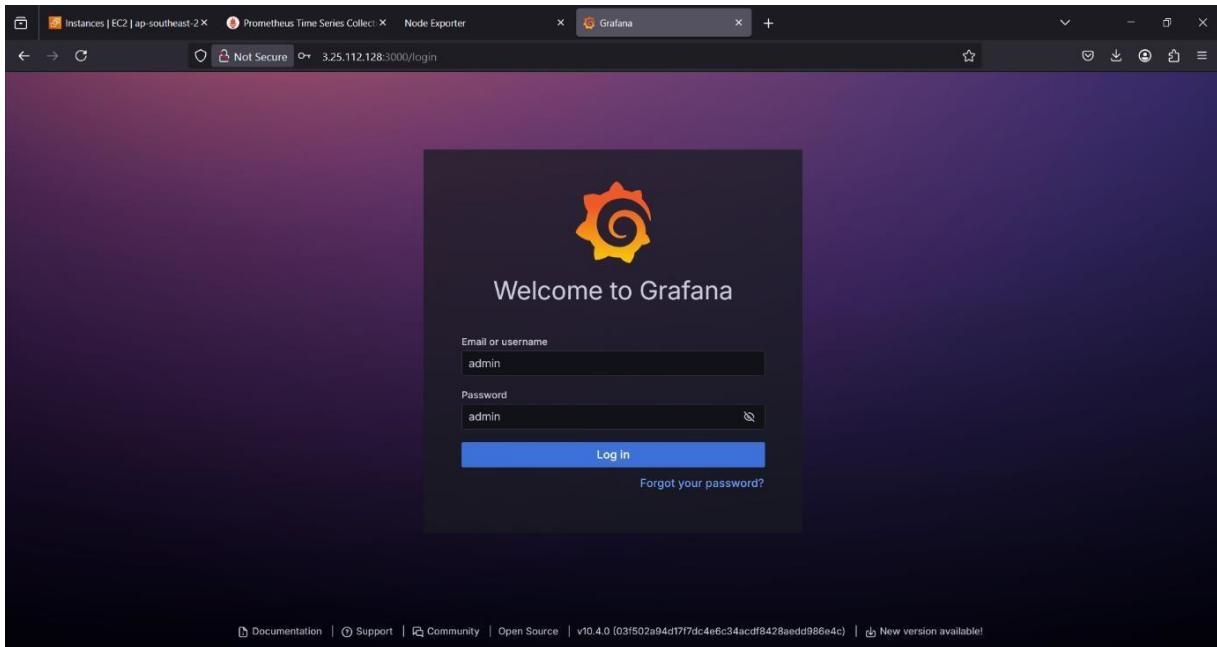

systemctl enable grafana-server After Installation:

1. add port 3000 in security group of EC2 (Grafana runs on port no 3000).

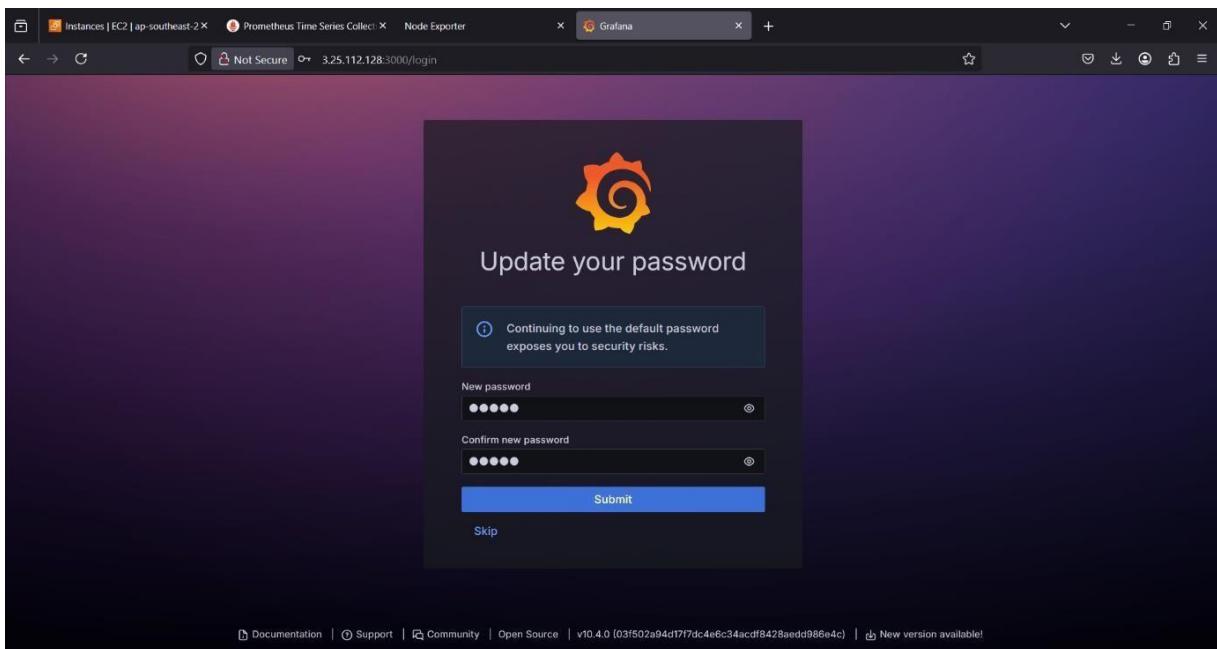

Security group rule ID	Type	Protocol	Port range	Source	Description - optional
sgr-00d6e949f81eb86cd	HTTPS	TCP	443	Custom	
sgr-0cd0f6796537b3859	HTTP	TCP	80	Custom	
sgr-00370bd7c632fa9a6	SSH	TCP	22	Custom	
-	Custom TCP	TCP	3000	Anyw...	

2. copy ec2 public IP and paste in browser with port no 3000 now you should see Grafana dashboard

3. login with default username and password which is admin admin

4. You'll be prompted to set a **new password** on first login.

Data Source in Grafana

Grafana doesn't store data itself — it connects to external systems called data sources like:

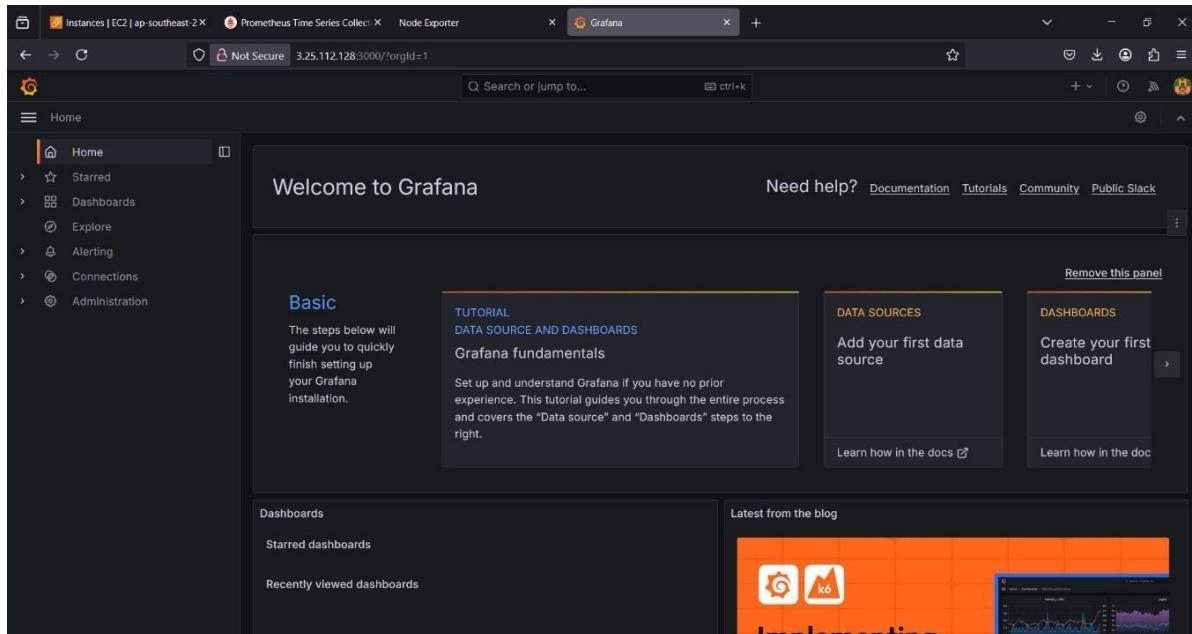

- **Prometheus** (for metrics)
- **MySQL/PostgreSQL** (for databases)
- **Elasticsearch**

- CloudWatch
- And many others

Once a data source is connected, Grafana can fetch data, visualize it, and build dashboards in real time

How to add Data Source ?

1. Navigate to Data Sources click “Add data source”

2. Select Prometheus from the list
3. Configure Prometheus Settings

In the URL field, enter:

- If Prometheus is on the **same server**: **<http://localhost:9090>**
- If Prometheus is on a **different server**, use: **<http://<Prometheus-IP>:9090>**

The screenshot shows the 'Data Sources / Prometheus' configuration page in Grafana. At the top, there's a logo and the text 'Data Sources / Prometheus' with 'Type: Prometheus'. Below this, there are two tabs: 'Settings' (which is selected) and 'Dashboards'. The main area is titled 'HTTP' and contains fields for 'URL' (set to 'https://localhost:9090'), 'Access' (set to 'Server (default)'), and 'Whitelisted Cookies' (with an 'Add' button). Under the 'Auth' section, 'Basic auth' is turned on with 'With Credentials' also checked. Other authentication options like 'TLS Client Auth', 'Skip TLS Verify', and 'Forward OAuth Identity' are turned off. There are also 'Help' and 'Default' buttons.

4. Leave the other settings as default click “Save & Test”

You should see a green message: “Data source is working”

What is a Dashboard?

A dashboard in Grafana is a collection of panels that display different types of monitoring data like CPU usage, memory, disk I/O, network traffic, etc., in real-time using graphs, charts, gauges, and tables.

Dashboards make it **easy to understand system performance** at a glance. Instead of reading raw numbers, you can view the health of your servers, applications, or infrastructure visually.

Start Creating Dashboards

Once Prometheus is connected: Go to the “+” icon on the left click “Dashboard” → then “Add new panel”. Choose **Prometheus** as the data source

In the **metrics browser**, start typing metric names like:

- Click Run Query
- A graph will appear with live data

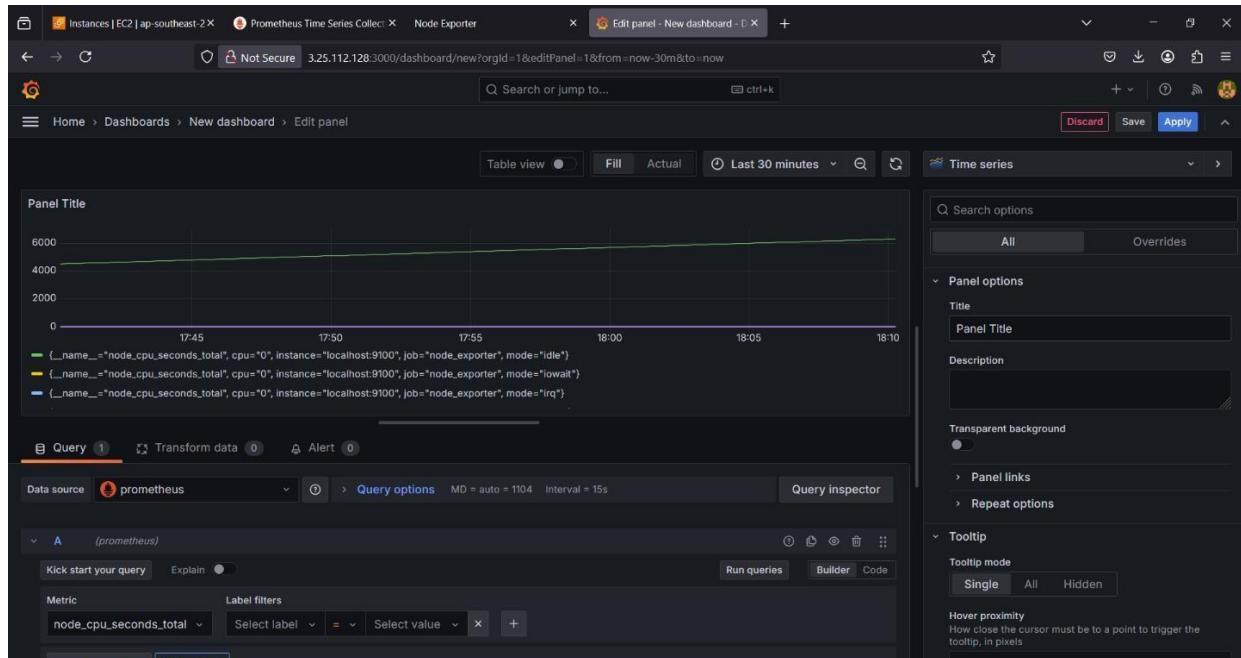

Customize the Visualization

Click the Panel Title → Edit Choose visualization type:

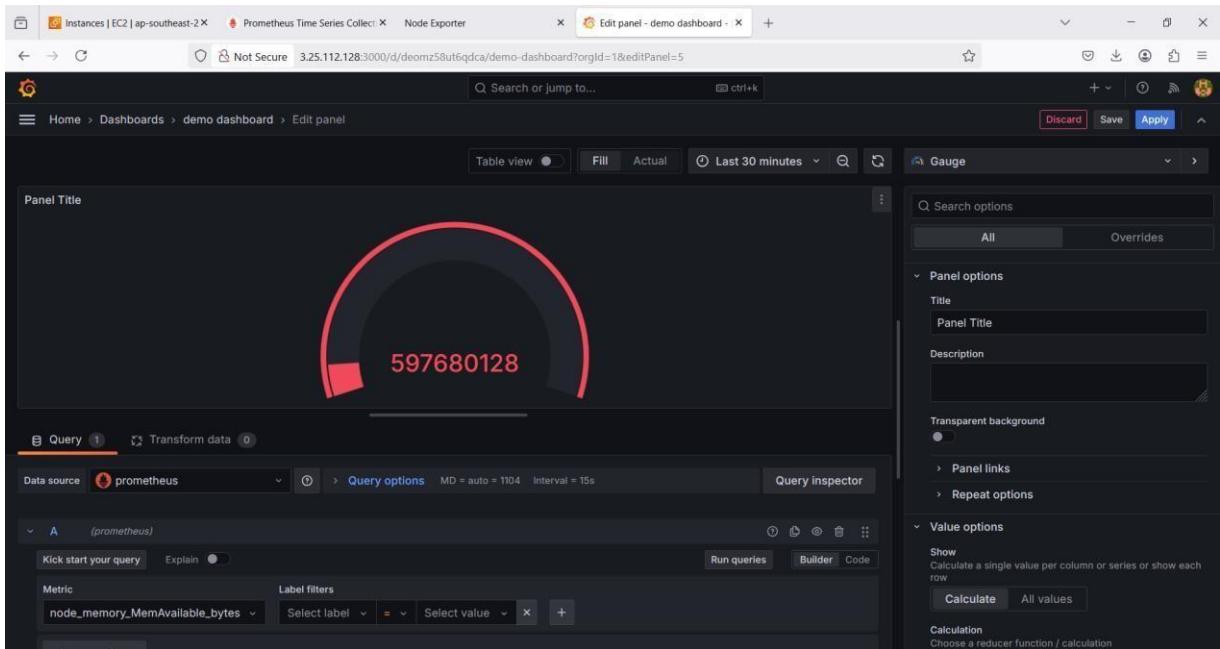

- Graph
- Gauge
- Table
- Pie Chart, etc.

Configure legends, units, colors, and thresholds

a. node_cpu_seconds_total

b. node_memory_MemAvailable_bytes

Save the Dashboard

- Click Save icon
- Enter a name for your dashboard
- Click Save

Add More Panels (Optional)

- Click Add panel to include additional metrics □ Repeat the above steps for each panel.
